FILING FIREPROOF

Stage 1

Safes are precisely engineered to surpass the strictest industry standards. Our seamless construction approach eliminated all the vulnerabilities found in older designs, locking your valuables even more securely than ever. Our premium formulated ultra fine bubble concrete provides the most effective insulation against intense heat.

Stage 2

The safe was placed in an air-tight gas furnace and subjected to intense heat of 1010 C (1850 F) for 120 mins. The impacted safe was subjected to another round of intense heating at 843 C (1550 F) for half an hour to test its structural integrity.

Stage 3

The impact test gives extra assurance that the drawers will not jar open, if the cabinet falls through a floor or is hit by falling beams or debris.

remained intact
Contents inside all drawers

SAFES

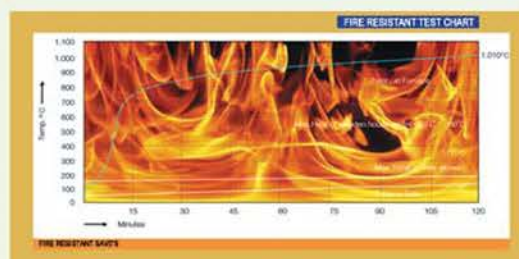

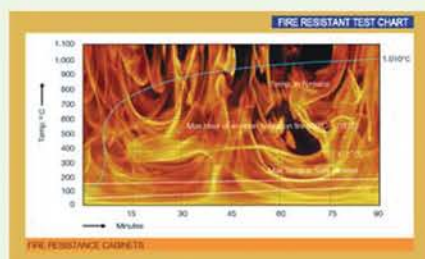

While the safe was red hot, it was dropped from a height of 4 metres onto hard ground to simulate the combined effects of heat degradation and impact.

We subject our DONATI safes to the most rigorous tests to ensure they perform faultlessly under all conditions. One of our tests simulates the worst case scenario of a safe in a fire, falling through the floor it rests on, and being subjected to another round of intense fire after the impact of the fall.

Some of the metal fittings on the external door melted due to the heat but the contents and interior of the safes remained perfectly intact. The internal temperature peaked at 120 C, well below the paper tolerance level of 177 C. In fact, the colour of the paper remained unchanged.
